ABSTRACT:

PROBLEM TO BE SOLVED: To provide a benefit association type charging system which reflects business having a future or developmental potential by charging a service user at a service providing price that a service provider pays low according to benefit expansion such as the growth, efficiency, etc., of the business of the service user.

SOLUTION: A benefit association type charging system comprises a processor which controls the whole system, a display part which controls image display, a reference price setting part which calculates a reference price as the lower limit of the provision price of service, a benefit coefficient calculation part which finds a coefficient that the calculation of a benefit associative amount is based on, a simulation part which calculates an effective service price producing the result of the service user, and a database which stores various data. The server comprises a CPU, a memory, a hard disk, etc., and programs and data for operating the benefit association type charging system are stored in the hard disk to control the operations of the display part, reference price setting part, benefit coefficient calculation part, simulation part, and database part.
